

New Technology Implemented in Silmet's Capsule Production Lines

Silmet Ltd. has recently performed a major upgrade to its manufacturing site, implementing a cutting-edge weight-sorting technology introduced to date only in the pharmaceutical industry. The new weight sorter, custom designed to meet Silmet's strict specifications, guarantees precision handling and consistent accuracy to resolution of 2 mg to 3 mg for each individual capsule filled, eliminating the need for manual weighing of discarded capsules. Implementing the new weight sorter is just one of many recent improvements

implemented by Silmet's R&D, resulting in a higher standard of quality product than in the past.

Moshe Zalsman, CEO of Silmet, said, "In today's business environment, the challenges of bringing professional and consumer dental products successfully and profitably to market have never been greater. As an OEM manufacturer and a subcontractor for leading dental manufacturers, as well as for our own home brand, Silmet's R&D is constantly investigating new measures and technologies in order to improve our products and production efficiency."
